

Our Services

The (Identity) business division is dedicated to the development of network-enabled security devices. Areas of application include identity and access management.

The tokens primarily use non-contact transfer technology such as Bluetooth or RFID. Modern encryption procedures provide the security required by the small, smart devices. For reasons of space, however, the currently available cryptographic technologies cannot be used, and there are no libraries available for the applications. We have therefore brought together experts from the areas of embedded programming, electronics, transfer technologies, cryptology and specialists for open source applications in our competence center in order to turn innovative ideas into reality.

This consolidation of expert knowledge at hardware and application level creates considerable synergy benefits across all business divisions, which helps us to provide our customers with comprehensive support.

For more information on the business division, please contact our [managing board](#).
