

IT risk management

Forward-looking companies look into IT risk management at an early stage, as this is the only way that risks can be identified in good time and business-critical systems can be protected. The more dependent a company is on functioning IT systems (e.g. in the case of e-business providers), the more importance must be attached to IT. Every disruption could have serious repercussions for these companies, and not just result in huge costs but also damage their reputation.

As an external consulting firm specializing in the application level, we take on tasks relating to IT risk management or support internal resources in implementing the necessary processes and quality assurance systems.

Our range of services:

- Risk evaluation as the basis for action options
- Setup of communication structures for emergency scenarios
- Definition of business continuation and restart plan
- Introduction of processes for business continuity management
